# GitHub GIT CHEAT SHEET

Git is the free and open source distributed version control system that's responsible for everything GitHub related that happens locally on your computer. This cheat sheet features the most important and commonly used Git commands for easy reference.

## **INSTALLATION & GUIS**

With platform specific installers for Git, GitHub also provides the ease of staying up-to-date with the latest releases of the command line tool while providing a graphical user interface for day-to-day interaction, review, and repository synchronization.

## **GitHub for Windows**

https://windows.github.com

# **GitHub for Mac**

https://mac.github.com

For Linux and Solaris platforms, the latest release is available on the official Git web site.

## Git for All Platforms

http://git-scm.com

## **SETUP**

Configuring user information used across all local repositories

git config --global user.name "[firstname lastname]"

set a name that is identifiable for credit when review version history

git config --global user.email "[valid-email]"

set an email address that will be associated with each history marker

git config --global color.ui auto

set automatic command line coloring for Git for easy reviewing

# **SETUP & INIT**

Configuring user information, initializing and cloning repositories

## git init

initialize an existing directory as a Git repository

## git clone [url]

retrieve an entire repository from a hosted location via URL

## **STAGE & SNAPSHOT**

Working with snapshots and the Git staging area

## git status

show modified files in working directory, staged for your next commit

## git add [file]

add a file as it looks now to your next commit (stage)

## git reset [file]

unstage a file while retaining the changes in working directory

## git diff

diff of what is changed but not staged

## git diff --staged

diff of what is staged but not yet committed

## git commit -m "[descriptive message]"

commit your staged content as a new commit snapshot

# **BRANCH & MERGE**

Isolating work in branches, changing context, and integrating changes

## git branch

list your branches. a \* will appear next to the currently active branch

## git branch [branch-name]

create a new branch at the current commit

## git checkout

switch to another branch and check it out into your working directory

## git merge [branch]

merge the specified branch's history into the current one

## git log

show all commits in the current branch's history

## **INSPECT & COMPARE**

Examining logs, diffs and object information

## git log

show the commit history for the currently active branch

## git log branchB..branchA

show the commits on branchA that are not on branchB

# git log --follow [file]

show the commits that changed file, even across renames

## git diff branchB...branchA

show the diff of what is in branchA that is not in branchB

## git show [SHA]

show any object in Git in human-readable format

# **SHARE & UPDATE**

Retrieving updates from another repository and updating local repos

## git remote add [alias] [url]

add a git URL as an alias

## git fetch [alias]

fetch down all the branches from that Git remote

# git merge [alias]/[branch]

merge a remote branch into your current branch to bring it up to date

## git push [alias] [branch]

Transmit local branch commits to the remote repository branch

## git pull

fetch and merge any commits from the tracking remote branch

## TRACKING PATH CHANGES

Versioning file removes and path changes

## git rm [file]

delete the file from project and stage the removal for commit

# git mv [existing-path] [new-path]

change an existing file path and stage the move

## git log --stat -M

show all commit logs with indication of any paths that moved

# **REWRITE HISTORY**

Rewriting branches, updating commits and clearing history

## git rebase [branch]

apply any commits of current branch ahead of specified one

## git reset --hard [commit]

clear staging area, rewrite working tree from specified commit

# **IGNORING PATTERNS**

Preventing unintentional staging or committing of files

# logs/

\*.notes pattern\*/

Save a file with desired patterns as .gitignore with either direct string matches or wildcard globs.

# git config --global core.excludesfile [file]

system wide ignore pattern for all local repositories

# **TEMPORARY COMMITS**

Temporarily store modified, tracked files in order to change branches

## git stash

Save modified and staged changes

## git stash list

list stack-order of stashed file changes

# git stash pop

write working from top of stash stack

# git stash drop

discard the changes from top of stash stack

# **GitHub** Education

Teach and learn better, together. GitHub is free for students and teachers. Discounts available for other educational uses.

# **Git Cheat Sheet**

# 01 Git configuration

\$ git config --global user.name "Your Name"

Set the name that will be attached to your commits and tags.

\$ git config --global user.email "you@example.com"

Set the e-mail address that will be attached to your commits and tags.

\$ git config --global color.ui auto

Enable some colorization of Git output.

# 02 Starting A Project

\$ git init [project name]

Create a new local repository. If [project name] is provided, Git will create a new directory name [project name] and will initialize a repository inside it. If [project name] is not provided, then a new repository is initialized in the current directory.

\$ git clone [project url]

Downloads a project with the entire history from the remote repository.

# 03 Day-To-Day Work

#### \$ git status

Displays the status of your working directory. Options include new, staged, and modified files. It will retrieve branch name, current commit identifier, and changes pending commit.

## \$ git add [file]

Add a file to the **staging** area. Use in place of the full file path to add all changed files from the **current directory** down into the **directory tree**.

## \$ git diff [file]

Show changes between working directory and staging area.

## \$ git diff --staged [file]

Shows any changes between the staging area and the repository.

#### \$ git checkout -- [file]

Discard changes in **working directory**. This operation is **unrecoverable**.

## \$ git reset [file]

Revert your **repository** to a previous known working state.

## \$ git commit

Create a new **commit** from changes added to the **staging area**. The **commit** must have a message!

GitLab | everyone can contribute about.gitlab.com

#### \$ git rm [file]

Remove file from working directory and staging area.

## \$ git stash

Put current changes in your working directory into stash for later use.

## \$ git stash pop

Apply stored **stash** content into **working directory**, and clear **stash**.

## \$ git stash drop

Delete a specific **stash** from all your previous **stashes**.

# 04 Git branching model

## \$ git branch [-a]

List all local branches in repository. With **-a**: show all branches (with remote).

#### \$ git branch [branch\_name]

Create new branch, referencing the current **HEAD**.

## \$ git checkout [-b][branch\_name]

Switch **working directory** to the specified branch. With **-b**: Git will create the specified branch if it does not exist.

## \$ git merge [from name]

Join specified [from name] branch into your current branch (the one you are on currently).

## \$ git branch -d [name]

Remove selected branch, if it is already merged into any other.
-D instead of -d forces deletion.

# 05 Review your work

## \$ git log [-n count]

List commit history of current branch. -n count limits list to last  $\boldsymbol{n}$  commits.

## \$ git log --oneline --graph --decorate

An overview with reference labels and history graph. One commit per line.

## \$ git log ref..

List commits that are present on the current branch and not merged into **ref**. A **ref** can be a branch name or a tag name.

## \$ git log ..ref

List commit that are present on **ref** and not merged into current branch.

## \$ git reflog

List operations (e.g. checkouts or commits) made on local repository.

\$ 9:7 branch - to show branches in githalb

GitLab | everyone can contribute

# 06 Tagging known commits

## \$ git tag

List all tags.

## \$ git tag [name] [commit sha]

Create a tag reference named **name** for current commit. Add **commit sha** to tag a specific commit instead of current one.

## \$ git tag -a [name] [commit sha]

Create a tag object named **name** for current commit.

#### \$ git tag -d [name]

Remove a tag from local repository.

# 07 Reverting changes

#### \$ git reset [--hard] [target reference]

Switches the current branch to the **target reference**, leaving a difference as an uncommitted change. When **--hard** is used, all changes are discarded.

## \$ git revert [commit sha]

Create a new commit, reverting changes from the specified commit. It generates an **inversion** of changes.

# 08 Synchronizing repositories

## \$ git fetch [remote]

Fetch changes from the remote, but not update tracking branches.

#### \$ git fetch --prune [remote]

Delete remote Refs that were removed from the **remote** repository.

## \$ git pull [remote]

Fetch changes from the  $\boldsymbol{remote}$  and merge current branch with its upstream.

## \$ git push [--tags] [remote]

Push local changes to the **remote**. Use **--tags** to push tags.

## \$ git push -u [remote] [branch]

Push local branch to **remote** repository. Set its copy as an upstream.

**Commit** an object

 $\textbf{Branch} \hspace{0.5cm} \text{a reference to a commit; can have a } \textbf{tracked upstream}$ 

**g** a reference (standard) or an object (annotated)

**Head** a place where your **working directory** is now

GitLab | everyone can contribute

# A Git installation

For GNU/Linux distributions, Git should be available in the standard system repository. For example, in Debian/Ubuntu please type in the **terminal**:

#### \$ sudo apt-get install git

If you need to install Git from source, you can get it from git-scm.com/downloads.

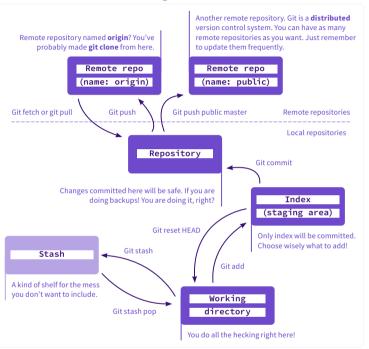

An excellent Git course can be found in the great **Pro Git** book by Scott Chacon and Ben Straub. The book is available online for free at git-scm.com/book.

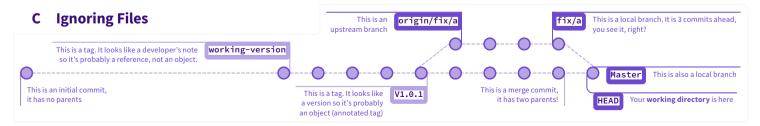

# **B** Ignoring Files

Verify the .gitignore file exists in your project and ignore certain type of files, such as all files in **logs** directory (excluding the .gitkeep file), whole **tmp** directory and all files \*.swp. File ignoring will work for the directory (and children directories) where .gitignore file is placed.

# D The zoo of working areas
